1 Introduction

motivation

2 Fundamental Principles

short introduction to EBSE,..

- **Evidence-based approach**: integrate all available research (evidence) in decision making process
- **Aim**: "EBSE aims to improve decision making related to software development and maintenance by integrating current best evidence from research with practical experience and human values." [3]
- **Five steps** of practising EBSE [7]:
    1. Ask an answerable question.
    2. Find the best evidence that answers that question.
    3. Critically appraise this evidence.
    4. Apply the evidence (and critical appraisal).
    5. Evaluate the performance in previous steps.
    → important tool: Systematic Literature Review (SLR)
- **SLR** [6]: identify and interpret all available literature regarding a research question → papers should be written for synthesis (TODO requirements for this, common mistakes/problems?)

3 Related Work

SEED, "a preliminary empirical investigation of the use of EBSE by undergraduate students"

4 Our Approach/Guidelines

4.1 Setting up our design guidelines

The checklist (TODO name?) is meant to implicitly guide the user's approach to experimenting. By guiding the user, typical mistakes might be prevented. To create guidelines that help preventing typical users' mistakes, these mistakes first need to be identified. In this section, experiences and guidelines found in related work are discussed. The conclusions are used as basis for design of our guidelines. The first set of guidelines is based on the report of Rainer et al. [8]:

Observation	Conclusion/Guideline
"Students had problems constructing well-formulated EBSE questions." (p. 6)	Give examples for good questions to make sure the user understands a good question's scope of information. Also, explicitly list which building blocks should be contained in the question.
"Students used limited criteria for identifying the best or better evidence[...]" (p. 6)	Support decision-making to get a decision as unbiased and suited as possible. Since a decision's quality is highly dependent on the individual case, we only give a very general hint to the user. The idea is to sensitize the user to consciously prevent bias as good as possible.
"Students used a very limited number of search terms." (p. 6)	If users look for something very specific without knowing the technical term, search engines might yield better results when used with more detailed search terms. Also, synonyms or similar words might widen the search's scope to find more related work. Encourage more search terms by providing examples containing enough search terms.
"Students provided poor explanation in their reports of how their searches were conducted." (p. 7)	TODO
"Students varied in their use of the EBSE checklist." (p. 7)	Design the checklist in a way to support the user's workflow instead of hindering it. Keep it possibly simple and provide enough examples to make the user never guess an item's meaning.
"Some students critically appraise the technologies rather than the publications (evidence) on the technologies" (p. 7)	TODO Give a hint/indication?
"But we also think that the kinds of problems students were tackling [...] are not the kinds of problems researchers commonly investigate." (p. 8)	Scientific and practical evidence can have very different requirements regarding content and other aspects such as duration of evaluation. To limit this paper's scope, we focus on scientific evidence.

4.2 Research Question, Hypothesis, and Objectives

For researchers to produce relevant results and understand their research domain fully, the step of developing a good research question, with a supporting hypothesis and sometimes objectives is integral [5]. These three components should be carefully designed before conducting the study that tries to answer the question. Otherwise it is more likely to produce questions that are already answered, or *"could potentially lead to spuriously positive findings of association through chance alone."* [5, p. 280]

Research Question The question the later study is designed to answer is called research question [2]. It should be an answerable question and address a relevant issue in the research area [4]. Preceding a research question is the need for a deep understanding of the topics that have already been studied, in order to produce questions which drive knowledge further. The questions that arise during the acquisition of knowledge, and cannot be answered by means of EBSE, are likely appropriate questions for further research [5].

There are two general classes of research questions: qualitative and quantitative questions. Qualitative research states questions which report, describe, or explore a subject [1, p. 139-141]. In computer science as the research field matures these questions become more and more rare (find source). Therefore focus is on quantitative research questions in this paper.

To understand the structure of research questions Shaw provides a model where she categorizes research questions from software engineering papers in five types [9] (maybe cut out).

- How to research question:
  - FINER & PICOT (Farrugia et al.)
  - Intervention/Contect/Effect (Kitchenham et al. 2005)
 - Research Design Book (Creswell)

Hypothesis

- What is it?
- For what is it?
- is testable statement (find source)
- Only in Quantitative research (Creswell)
- two-sided/one-sided hypothesis -> use only two-sided (Farrugia et al.)
- Null hypothesis in empirical work (Farrugia et al.)
- contains varaibales/population/relationship (health website)
- How to hypothesis:
  - (Prasad)
  - from websites (find sources)
  - (Creswell)

Objectives

– What is it?
– For what is it? (Farrugia et al., health Webpage)
– only for reasons of completion

4.3 Workflow
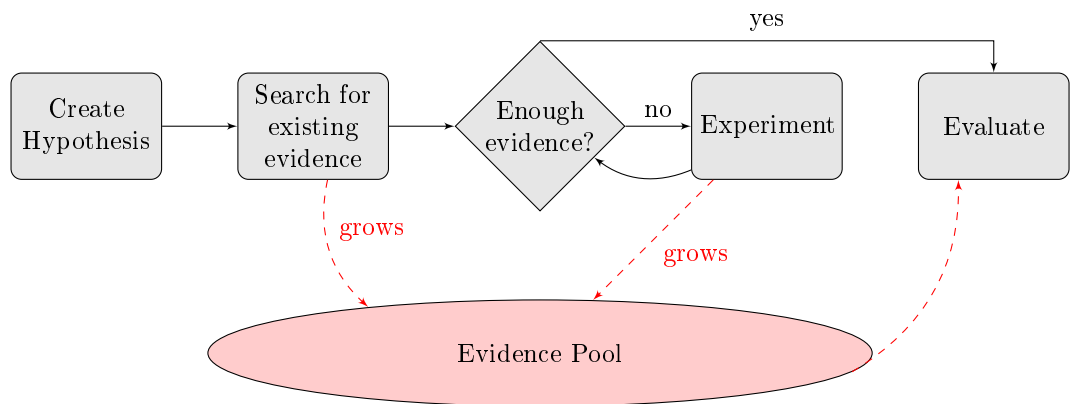

TODO:
Add numbers to each node, explain each node
Missing node: "Make Decision" at the end?
Layout/Style/Color

4.4 Checklist

Question

Contains **technology** in a **context** showing an **effect**. TODO Kitchenham Quote (practitioners)?
"Does pair programming in professional software development teams increases code quality?"

Hypothesis

Needs to contain a **prediction** and needs to be **testable**.
"If you do x, then y will happen"

Experiment

Context

Dependent Variables
Variables that are **measured** during the study.

Independent Variables
Variables that are **changed** during the study.

Method
Lab-/Field study, number of participants, metrics, ...

Results
Experiment's outcome
No interpretation or conclusion!

Conclusion

Interpretation of experiment's results.
Verifying or Falsifying Hypothesis.
Scope of generalization.

5 Discussion

i just cleaned this mess up..
